[illegible][illegible]

Figure 1 consists of two histograms side-by-side. The left histogram is for matrix A (size 10000x10000) and the right is for matrix B (size 10000x10000). Both histograms show the distribution of the number of non-zero elements per row. The x-axis represents the number of non-zero elements, ranging from 0 to 10000. The y-axis represents the frequency, ranging from 0 to 100. Both distributions are roughly bell-shaped, peaking around 1000-2000 non-zero elements per row.

Figure 1. The effect of the number of trials on the mean number of correct responses. The number of correct responses was significantly higher for the 10 trials condition than for the 5 trials condition. Error bars represent the standard error of the mean.

Abstract

[illegible]

Figure 6. The effect of the number of iterations on the accuracy of the proposed algorithm. The results are shown as the mean value of 10 trials. The error bars represent the standard deviation. The x-axis shows the number of iterations from 0 to 100,000. The y-axis shows the accuracy percentage from 80% to 95%. The legend indicates four different values of α : 0.001 (blue), 0.005 (orange), 0.01 (green), and 0.05 (red). All curves show an increase in accuracy over time, with higher α values generally leading to faster convergence.
